

Bilaga 2. Utlysning

We are seeking a student for a 6 month project (starting January 2026) at the Institute of Biomedicine, Department of Medical Biochemistry & Cell Biology. A stipend will be provided.

Project: *Analysis of factors prognostic of survival in melanoma using publicly available genomic data*

This project uses publicly available genomic datasets to investigate clinical and molecular factors associated with patient survival in melanoma. By integrating genomic data with linked clinical information, the student will explore how features derived from sequencing analyses relate to established prognostic markers and outcomes. The aim is to identify patterns or associations that improve understanding of melanoma prognosis and illustrate how large-scale genomic resources can be used to study factors influencing survival.

For more information about the project, please contact Erik Larsson Lekholm:
