6. Research interest

Marie Thynell is active in Environmental Social Science, Development Research and Urban Studies. She focuses on local expressions of global change such as global cities, sustainable, healthy and just cities, as well as sustainable transport. Additionally, policies, planning and implementation of Agenda 2030, the new urban agenda, access and mobility, social equity and gender perspectives are also researched. A combination of methods is applied, and the analysis builds on theoretical contributions from International Political Economy, Global City Research, Critical Development Research and Environmental Governance.

Thynell has extensive experience from in-depth, interdisciplinary approaches, and learning in collaboration with diverse stakeholders in different parts of the world. She has carried out case studies in Xian, Hanoi,

New Delhi, Petrozavodsk, Skopje, Rome, Copenhagen, Brasília, Santiago, Nairobi, Jakarta, Santiago, Nairobi, Beijing and Hong Kong.

Three main agendas are distinguished, *Firstly*, sustainable cities and air quality management engaging with climate change adaptation. Thynell is inquiring the nexus of science and policy in transdisciplinary and multi-stakeholder projects in Beijing, Hong Kong, Nairobi, and Kisumu, together with researchers from the Gothenburg Air and Climate Science Center, GAC, and Urban Futures at GMV, GU and Chalmers. See also the article on photochemical smog in China, 2016, and another one published in The Guardian, “There is no escape!: Nairobi’s air pollution sparks Africa health warning” July 2016, <http://gu.com/p/4yx4q/sbl>, about air quality management and socio-economics in slum settlements.

Secondly, in *Coping with recurrent emergency: the self-organization of civil society in Jakarta during flooding* research on environmental issues as drivers of city development is targeted. In this project, the fragile aspects of global cities such as risks and socio-economic vulnerabilities are explored from the point of view of resilience and environmental stress caused by investment-driven city development and climate change. Furthermore, in times of climate change the role of the large and marginalized population is explored from the point of view of inequality and participatory development.

Thirdly in order to study the character and adversaries associated with mass-motorisation in different state-market relations, a research agenda on international sustainable transport, focusing on the environmental and social aspects of access and mobility in cities has been developed. A long number of topics and cases are documented together with policy work and interdisciplinary theorizing at the nexus of development and environment. One of the first was her Dr. dissertation *The Unmanageable Modernity. An Explorative Study of Motorized Mobility in Development*, 2003 and the latest is “A New Approach to Mobility” published in *Sustainable Development Goals: building back better*, 2020.

Thynell is trained as a researcher in international political economy and development studies. She is an associated professor in Peace and Development research and her agendas come together in an overarching goal of challenging the division between the social and natural sciences in elaboration of larger dynamics of city development, theories of development, collective action, policy and cooperation in governance of resources. The transportation and mobility research overlaps with aspects of the global city and sustainable city studies. Her role as advisor to Urban Sustainability Future, 2020-2021, exemplifies the ability to embrace research for healthy, just and sustainable cities, targeting the challenges in secondary cities in Kenya and the SSA-region New and non-environmental determinist understandings of society-environment interactions are also analysed and theorized, especially ones that can account for power, politics, and social dynamics. However, her broad research interests bring her to publish in a different direction as well. Two articles, “Urbanome” published by *Nature Comments* and, “How to build Urbanome, the genome for the city?” are developed in a global network of science and health researchers and submitted to *Nature Sustainability* in 2020.
